Feature Verification — Financial Data Aggregation & Financial Insights

Banfico “AI-Powered Fintech Experience” Hackathon — Team-H

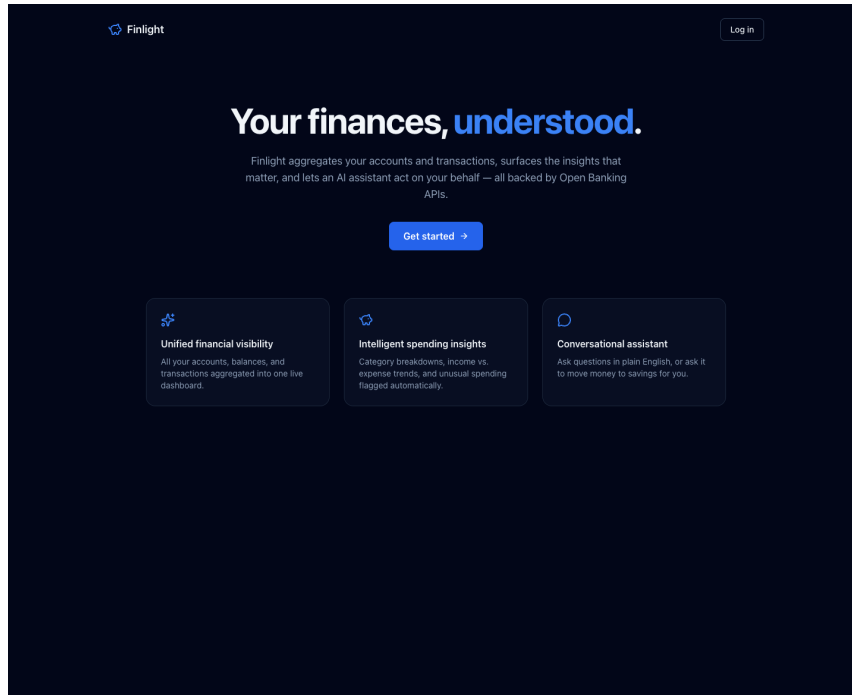

This document walks through each required feature with a screenshot of the actual running application (React + Vite client, Express API server proxying the Banfico OBIE AISP v4.0 mock bank sandbox). Screenshots use realistic sample transaction data seeded for demonstration purposes, rendered through the real UI.

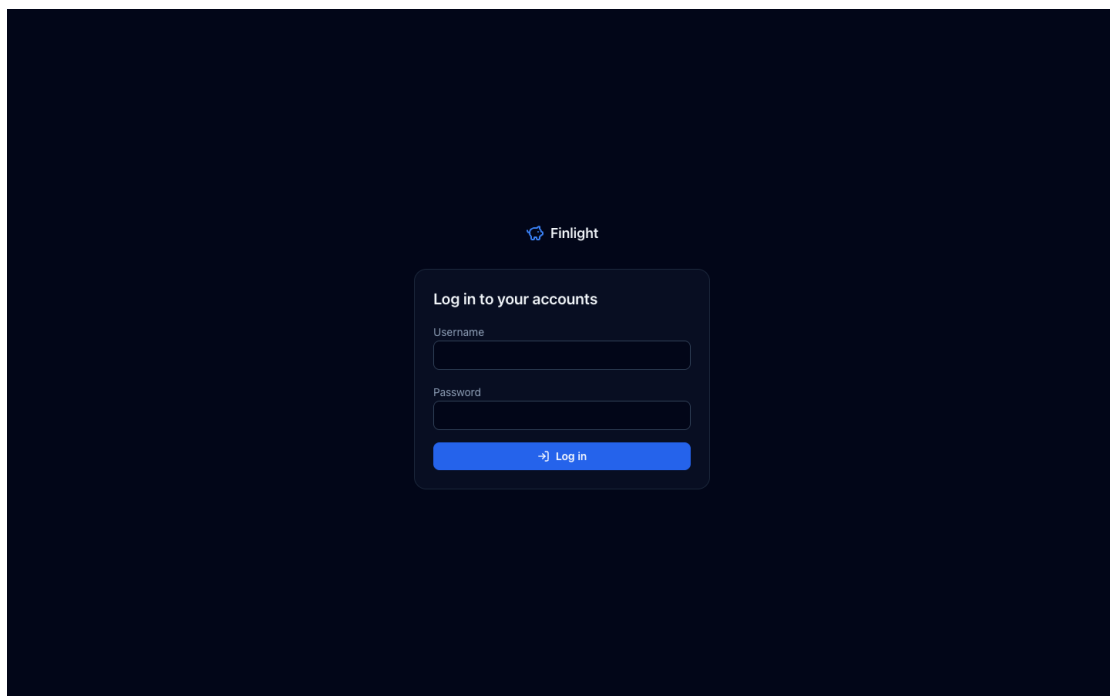

1. Financial Data Aggregation

The app is a full portal: an unauthenticated marketing home page, a login page that authenticates against the bank sandbox, and an authenticated dashboard that aggregates accounts, balances, and transaction history into one unified view.

Portal: home page and login page

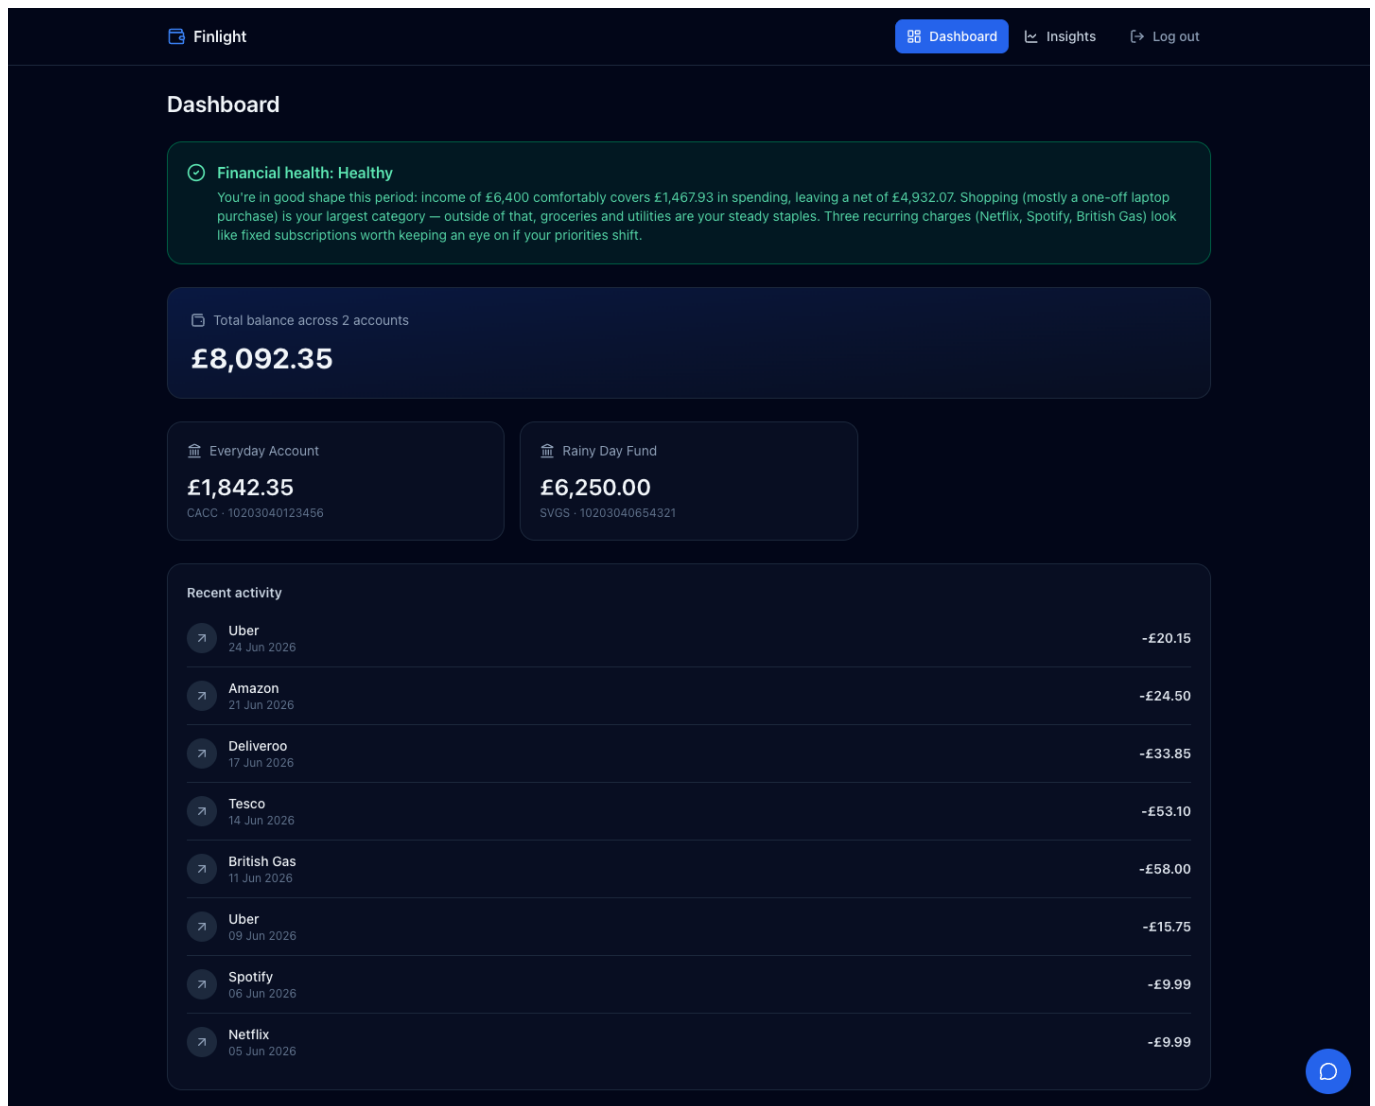

Home page — unauthenticated landing page with product overview and a call to action into login.

Login page — authenticates directly against the Banficio sandbox's OIDC token endpoint via the Express server; credentials are never stored.

Fetch and display account information, retrieve balances, and unified dashboard view

Dashboard — every account is fetched from the bank API and shown as a card with its live balance (Everyday Account, Rainy Day Fund), alongside a total-balance summary across all accounts and a feed of recent transactions across the whole portfolio — the single unified view the requirement calls for.

Retrieve transaction history

↻ Tesco	02 May 2026	-£64.32
✓ Salary	01 May 2026	+£3,200.00

Account detail — drilling into an account shows its balance and full transaction history, retrieved live from the bank API's transactions endpoint.

2. Financial Insights

Transaction data is aggregated server-side into spending summaries, monthly trends, category breakdowns, anomaly detection, and a financial health assessment — narrated in plain English by Claude on top of deterministic, precomputed statistics.

Insights page — every bullet below is visible on this single screen.

- **Spending summaries.** Income, expense, and net totals for the period (top card: £6,400.00 income, £1,467.93 expense, £4,932.07 net).
- **Monthly spending analysis.** “Income vs. expense by month” bar chart breaks totals down per calendar month (2026-05, 2026-06).
- **Category-wise expenditure insights.** “Spending by category” donut chart groups spend into Groceries, Dining, Transport, Utilities, Entertainment, and Shopping.
- **Income vs. expense trends.** The same monthly bar chart directly compares income (green) against expense (red) side by side per month.
- **Unusual spending detection.** “Unusual spending” flags the £850.00 Curry’s PC World purchase as statistically unusual versus that category’s median spend.
- **Financial health observations.** The health card labels the period “Healthy” and gives a Claude-generated plain-English narrative grounded in the exact totals above — also surfaced as a proactive banner on the dashboard.
